

# Control of back flow in animal feed

## The challenge

In animal feed production, a backflow sensor was needed in a tube. This should not detect the material flow in the shaft, but only when the shaft is clogged from below. The animal feed is sticking.

## Our solution

A robust and reliable solution in this application is the rotating paddle switch RN3001. This sensor works independent of sticky solids. The stainless steel probe has a high mechanical stability and a long lifetime.

## Produits

### RN 3001

Détecteur de plein, de besoin ou de vide

Version courte

- Montage vertical, horizontal et oblique dans le container.
- Très compact à partir d'une longueur de bras de 70mm
- Particulièrement adapté pour les petits containers de processus
